# The broader policy context: driving eco-innovation

---

- Environment
- EU competitiveness

What are the policy goals?

**clean, secure and efficient energy system**

More than goal requires more than one policy

**Where is competitiveness?**

**When and how should the policy goals be changed?**

---

# What does a systems approach to innovation tell us?

---

---

- Common vision
- Strong innovation system networks,
- Demand supported by institutions for standards, procedures
- Stable innovation policies
- Learning and adaptation

**are all essential for new technologies to be taken up**

---

# What is missing?

---

---

- **Who will win and who will lose?**
  - countries, regions, cities, corporations, people
- In a centralised energy sector, **how to promote decentralised systems?**
- **How to enable new household producers or energy efficiency service providers?**

**How to enable a different e.g. climate neutral energy system?**
